

# EXHIBIT 2

PATIENT'S NAME: Tyrone Keys

DATE: August 1, 2003  
CHART: KEYTY000  
DOI: 03/20/02

PLAN OF MANAGEMENT CONTINUED:

Because of this patient's persistent symptoms he becomes a candidate for pain management consultation to include facet injections and associated trigger points and neural foraminal injections. Such consultations characteristically cost about \$10,000 and are necessary semi-annually for undetermined periods of time. This patient is a candidate and we are going to make appropriate arrangements for such consultations. The patient is in agreement with this.

Based on the findings that this patient has at his age, he is going to progress both his cervical and lumbar conditions with advancing stenosis in both areas with nerve root impingement requiring lumbar decompressions with fusion and the same is true of his cervical spine. The global cost for a procedure of this nature is between \$40,000 and \$50,000 and it is my opinion that this will be required during the course of his lifetime. The patient was also advised of this.

The patient will be seen in the future as his symptoms dictate.

-2-

These imaging studies revealed an abnormal degree of degenerative osteoarthritis in Mr. Keys' cervical spine, lumbar spine, and knees, which were all existing prior to the May 7, 2002, accident. The arthritic lesions demonstrated are largely the result of his football activities.

If you have any questions regarding the above opinions, please contact me personally at (813) 876-9552.

Sincerely,

*Richard F. Shaker, D.C.*
